Appl. No. 09/444,083

Amdt. dated January 26, 2004

20. (previously amended) An absorbent article, comprising:

an absorbent chassis defining a longitudinal axis, a transverse axis, front and back waist edges parallel to the transverse axis, opposite side edges extending between the front and back waist edges, a front waist region contiguous with the front waist edge, a back waist region contiguous with the back waist edge, and a crotch region which extends between and interconnects the front and back waist regions, the absorbent chassis comprising:

a rectangular composite structure having opposite linear side edges parallel to the longitudinal axis and opposite linear end edges parallel to the transverse axis, the composite structure comprising a bodyside liner, an outer cover bonded to the bodyside liner, and an absorbent assembly disposed between the bodyside liner and the outer cover;

first and second front side panels bonded to the composite structure in the front waist region;

first and second back side panels bonded to the composite structure in the back waist region;

a fastening system for releasably securing the absorbent article in a pant-like configuration, the fastening system comprising first and second fastening components connected to the respective first and second back side panels and adapted to releasably engage first and second mating fastening components connected to the respective first and second front side panels; and

elastomeric components transversely disposed between the fastening components and the absorbent assembly;

wherein a transverse distance between the first and second fastening components is substantially equal to a transverse distance between the first and second mating fastening components,

wherein the pant-like configuration defines a waist opening and leg openings and engagement of the fastening components and mating fastening components defines refastenable seams, the refastenable seams covering about 90 to about 98 percent of a distance between the waist opening and the leg openings.

Appl. No. 09/444,083

Amdt. dated January 26, 2004

²22. (previously amended) An absorbent article, comprising:

1
End
an absorbent chassis defining a longitudinal axis, a transverse axis, first and second waist edges parallel to the transverse axis, opposite side edges extending between the first and second waist edges, a first waist region contiguous with the first waist edge, a second waist region contiguous with the second waist edge, and a crotch region which extends between and interconnects the first and second waist regions, the absorbent chassis comprising:

a rectangular composite structure having opposite linear side edges parallel to the longitudinal axis and opposite linear end edges parallel to the transverse axis, the composite structure comprising a bodyside liner, an outer cover bonded to the bodyside liner, and an absorbent assembly disposed between the bodyside liner and the outer cover;

first and second elastomeric side panels bonded to the composite structure in the first waist region;

first and second elastomeric side panels bonded to the composite structure in the second waist region;

support members bonded to and extending transversely outward from the first and second elastomeric side panels in the first waist region;

support members bonded to and extending transversely outward from the first and second elastomeric side panels in the second waist region; and

a fastening system for releasably securing the absorbent article in a pant-like configuration, the fastening system comprising first and second mating fastening components disposed on the support members in the first waist region adapted to releasably engage first and second fastening components disposed on the support members in the second waist region;

wherein the elastomeric side panels in the first waist region are longitudinally spaced from the elastomeric side panels in the second waist region, and a width of the elastomeric side panels in the first waist region is the same as a width of the elastomeric side panels in the second waist region.

³23. (previously amended) The absorbent article of claim ²22, wherein the first and second fastening components comprise integral portions of the support members.

⁴24. (original) The absorbent article of claim ³23, wherein the support members comprise a loop material.

⁵
~~29.~~ (previously amended) A training pant for use in training a child to use the toilet, comprising:

an absorbent chassis defining a longitudinal axis, a transverse axis, an overall length dimension parallel to the longitudinal axis, front and back waist edges parallel to the transverse axis, opposite side edges extending between the front and back waist edges, a front waist region contiguous with the front waist edge, a back waist region contiguous with the back waist edge, and a crotch region which extends between and interconnects the front and back waist regions, the absorbent chassis comprising:

a rectangular composite structure having opposite linear side edges parallel to the longitudinal axis and opposite linear end edges parallel to the transverse axis, the composite structure comprising:

- (a) a liquid permeable bodyside liner;
- (b) a liquid impermeable outer cover bonded to the bodyside liner, the outer cover comprising a liquid impermeable inner layer and a nonwoven outer layer;
- (c) an outer cover graphic disposed on the outer cover;
- (d) an absorbent assembly comprising hydrophilic fibers disposed between the bodyside liner and the outer cover; and
- (e) leg elastic members longitudinally aligned along the side edges of the composite structure;

first and second front side panels bonded to the composite structure in the front waist region, each front side panel having a distal edge, an interior portion between the distal edge and the composite structure, a waist end edge parallel to the transverse axis and forming part of the front waist edge, and a leg end edge forming part of the side edge, the front side panels having

Appl. No. 09/444,083
Amdt. dated January 26, 2004

an average length dimension that is about 20 percent or greater of the overall length dimension of the absorbent chassis;

first and second back side panels bonded to the composite structure in the back waist region and longitudinally spaced from the first and second front side panels, each back side panel having a distal edge, an interior portion between the distal edge and the composite structure, a waist end edge parallel to the transverse axis and forming part of the back waist edge, and a leg end edge forming part of the side edge, the back side panels having an average length dimension that is about 20 percent or greater of the overall length dimension of the absorbent chassis; and

an elastomeric material disposed between nonwoven facing layers in at least the interior portions to render the side panels elastomeric in a direction generally parallel to the transverse axis; and

a fastening system for releasably securing the absorbent chassis in a pant-like configuration having a waist opening and a pair of leg openings, the fastening system comprising first and second fastening components adapted to releasably engage first and second mating fastening components, the first and second fastening components being connected to the respective first and second back side panels adjacent the distal edges, the first and second mating fastening components being connected to the respective first and second front side panels adjacent the distal edges, the fastening components and the mating fastening components each comprising mechanical fasteners having a length-to-width ratio of about 5 or greater, and engagement of the fastening components and mating fastening components defines refastenable seams that cover about 80 to 100 percent of a distance between the waist opening and the leg openings.
